

The company

BOGBALLE A/S is a long established and respected manufacturer, specialized in developing and producing high performance and durable mineral fertiliser spreaders.

The fact that the mineral fertiliser spreader is the only product in the BOGBALLE range requires a high innovation degree. We continuously need to perform to offer the best product of the market.

Therefore, through generations we have kept the strategy to deliver a product which to the farmer always will be a good investment. In this perspective delivering products of highest quality level, the most user-friendly and with a low need for service has proven to be a long-lasting foundation to ensure a healthy and stable business.

We produce our mineral fertiliser spreaders in a modern and high-technology production facility with high efficiency machines as welding and press brake robots, laser cutters and a powder paint plant. The quality control is extensive through out the production, which ensures consistent and reliable products.

Press brake robot in action

Together with the production facilities we have one of the most advanced test facilities in Europe. In our spreading hall for accuracy testing, we test different fertilisers to obtain the best spread pattern and to optimize the settings of the fertiliser spreader.

This contributes to that we repeatedly can mark ourselves within our speciality. We have proven our abilities in several tests where we in competition with other manufacturers have obtained extraordinary good test results.

Over the years BOGBALLE has been in front technically, for instance with the introduction of the worlds first hydraulic driven spreader. Since then followed up by spreaders with integrated weighing technique and the electronic controlling device CALIBRATOR with GPS Variable Rate Application.

CALIBRATOR ZURF

Today electronics and weighing technique are two of the cornerstones in the product range.

History

BOGBALLE was founded in 1934 by Mr. Anders Peter Laursen at his own home in the small village of Bøgballe in Denmark. Today the factory is still placed at the same address in Bøgballe from which the company name originates.

Entering the village of Bøgballe

The company has through the years produced various types of agricultural equipment. Up to the beginning of the 1950's the main production was poultry equipment. With the introduction of the tractor the idea of a centrifugal fertiliser spreader for spreading mineral fertiliser arose. Since 1950 the focus has solely been on developing, producing and distributing mineral fertiliser spreaders. Today BOGBALLE has reached a status as being one of the leading fertiliser spreader manufacturers

in Europe and we can claim to be "The Specialist" in spreading of mineral fertilisers.

We are represented worldwide and work with a loyal and strong network of dedicated importers. In each market the importer offers a strong know-how about the BOGBALLE spreaders and ensures qualified service and parts availability.

Today the BOGBALLE Company is still a family owned company, with the management of the third generation, handed over from Anders Peter Laursen to his son and today to the grandson, Nils Jørn Laursen. To secure the continuity, the company is today owned by the fourth generation.

The BOGBALLE Company

BOGBALLE in figures

-  Total area under roof 20.000 m²
-  95% of the turnover is exported to more than 95 export markets
-  85% of the spreader parts are produced in-house
-  70 dedicated employees
